

# Determination of Calcium and Magnesium in Water

## Description

The determination of the Calcium and Magnesium next together in water is done by titration with the sodium salt of ethylenediaminetetraethanoic acid (EDTA) at pH 8 - 9, the detection is carried out with a Ca electrode. The result is calculated as mg/l Ca<sup>2+</sup> respectively mg/l Mg<sup>2+</sup>.

## Instruments

|                     |                                    |
|---------------------|------------------------------------|
| Titrator            | TL 7000 or higher                  |
| Electrode           | Ca 1100 PLH                        |
| Cable               | L 1 A                              |
| Reference electrode | B 2920+                            |
| cable               | L 1 N                              |
| Stirrer             | Magnetic stirrer TM 235 or similar |
| Lab accessory       | Glass beaker 150 ml                |
|                     | Magnetic stirrer bar 30 mm         |

## Reagents

|   |   |
|---|---|
| 1   | Na <sub>2</sub> EDTA 0.05 or 0.1 mol/l  |
| 2   | Acetylacetone                           |
| 3   | Tris(hydroxymethyl)-aminomethane (TRIS) |
| 4   | Distilled Water                         |
| 5   | Electrolyte solution L300               |
| All reagents should be of analytical grade or better. |   |

## **Titration procedure**

### **Reagents**

The titer determination of the EDTA solution is carried out as described in the application note "Titer determination of EDTA".

TRIS / Acetylacetone Buffer solution

Dissolve 20.4 g of TRIS in water, add 12 ml of Acetylacetone and make up to 1.0 liter with water.

### **Cleaning of the electrode**

The electrodes are cleaned with distilled water. The Ca 1100 is stored clean and dry, for the storage of the reference electrode use electrolyte solution L300.

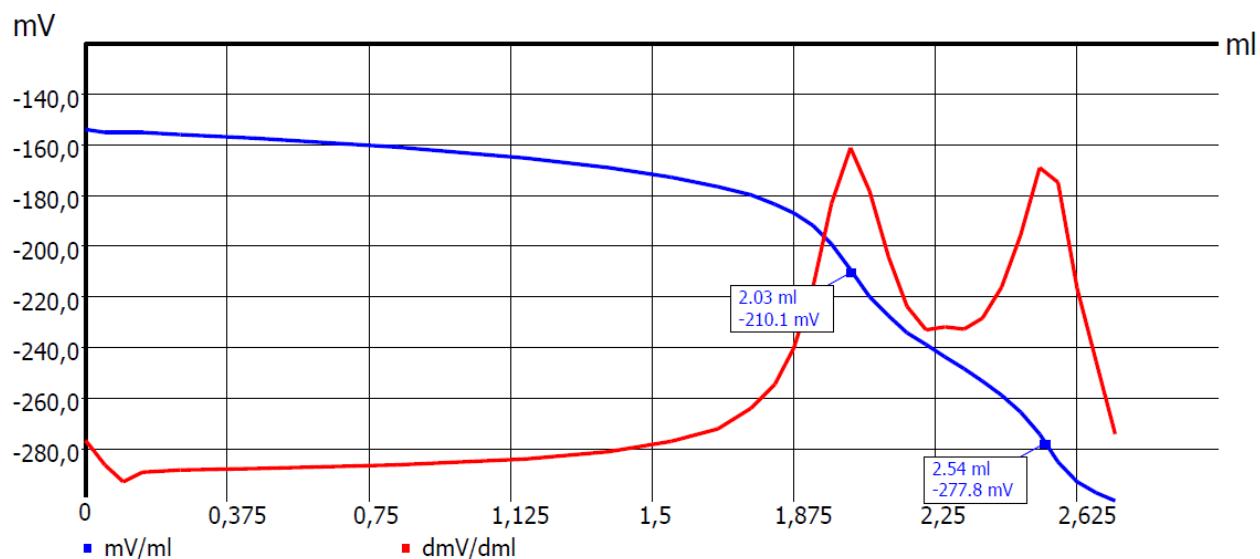

### **Sample preparation**

100.00 ml of sample are placed in a 150 ml beaker, 15 ml TRIS / Acetylacetone buffer solution are added. Then it is titrated with Na<sub>2</sub>EDTA 0.05 or 0.1 mol / l to 2 equivalence points. The first equivalence point corresponds to the Ca<sup>2+</sup> content, the second to the Mg<sup>2+</sup> content of the sample. The consumption should be about 5 - 15 ml. For very hard water samples, the amount of sample may be reduced, for very soft water samples, a lower concentration EDTA solution may be needed.

## Titration parameter

### Sample titration

|                         |                     |                      |          |
|-------------------------|---------------------|----------------------|----------|
| Default method          | Ca and Mg           |                      |          |

| Modus                   | Dynamic             |                      |          |
| Measured value          | mV                  |                      |          |
| Measuring speed / drift | User defined        | Minimum holding time | 5 s      |
|                         |                     | Maximum holding time | 12 s     |
|                         |                     | Measuring time       | 4 s      |
|                         |                     | Drift                | 3 mV/min |
| Initial waiting time    | 0 s                 |                      |          |
| Dynamic                 | flat                | Max step size        | 0.5 ml   |
|                         |                     | Slope max ml         | 10       |
|                         |                     | Min. step size       | 0.05 ml  |
|                         |                     | Slope min. ml        | 120      |
| Damping                 | none                | Titration direction  | decrease |
| Pretitration            | off                 | Delay time           | 0 s      |
| End value               | off                 |                      |          |
| EQ                      | On (1)              | Slope value          | 120      |
| Max. titration volume   | 20 ml               |                      |          |
| Dosing speed            | 100%                | Filling speed        | 30 s     |

Calculation:

$$\text{Result } Ca^{2+} [\text{mg/l}] = \frac{(EQ1 - B) * T * M_{Ca} * F1}{V * F2}$$

$$\text{Result } Mg^{2+} [\text{mg/l}] = \frac{(EQ2 - EQ1) * T * M_{Mg} * F1}{V * F2}$$

|                 |        |  |
|-----------------|--------|--|
| B               | 0      | Blank value  |
| EQ1             |        | Consumption of titrant at first Equivalence point  |
| EQ2             |        | Consumption of titrant at second Equivalence point |
| T               | WA     | Actual concentration of the titrant                |
| M <sub>Ca</sub> | 40,08  | Molecular mass of Ca                               |
| M <sub>Mg</sub> | 24,305 | Molecular mass of Mg                               |
| V               | man    | sample volume [ml]                                 |
| F1              | 1000   | Conversion factor                                  |
| F2              | 1      | Conversion factor                                  |
